

7. The chef of a Canteen prepares 4 different kinds of Food while the Students order the food on their mobile. However, there are limited tables to serve at a time. Write an object oriented code for this **order management system**. The chef and students are **not blocking** each other and thus must run in separate threads. Students must wait if the table is empty, while the chef must wait if the table is full. You should know who is currently being served and who is waiting for what condition.
