First Paper

(Data Structure – I)

6. (a) "Recursion is not always advantageous to use instead of iteration" – Justify with a suitable example.
- (b) Write algorithm (or pseudocode) for insert and delete operations of a circular queue represented by an array.
- (c) Write an algorithm which removes the first element of a list and adds it to the end of the list without changing any values in INFO part. $3+(3+3)+5$
7. (a) What do you mean by column major representation of a 2D-array? Discuss with a suitable example.
- (b) Why is postfix expression advantages over infix expression? Convert the following infix expression into postfix by using stack.
 $(a+b)*c/d+c-(f+g).$
- (c) Write an algorithm to add two single variable polynomials.
- (d) What do you mean by priority queue? $3+(2+2)+5+2$
